An injection is obtained by dissolving the compound of the present invention or the concomitant drug and if desirable, a benzoate and/or a salicylate, and if necessary, the above-mentioned additives into water. These may be dissolved in any order, and can be appropriately dissolved in the same manner as in a conventional method of producing an injection.

It may be advantageous that an aqueous solution for injection is subjected to high pressure heat sterilization at 100 to 121°C for 5 to 30 minutes.

Further, a preparation endowed with an antibacterial property of a solution may also be produced so that it can be used as a preparation which is divided and administered multiple times.

As the binder, for example, polyvinyl alcohol,
30 hydroxypropyl cellulose, polyethylene glycol, polyvinyl pyrrolidone, Pluronic F68, gum Arabic, gelatin, starch and the like are used. As the disintegrant, for example, carboxymethylcellulose calcium (ECG505), crosscarmellose sodium (Ac-Di-Sol), crosslinked polyvinylpyrrolidone (Crospovidone),

low-substituted hydroxypropylcellulose (L-HPC) and the like are used. Among them, hydroxypropylcellulose, polyvinylpyrrolidone, low-substituted hydroxypropylcellulose are preferable. As the lubricant and coagulation inhibitor, for example, talc,
5 magnesium stearate and inorganic salts thereof are used, and as the lubricant, polyethylene glycol and the like are used. As the stabilizer, acids such as tartaric acid, citric acid, succinic acid, fumaric acid, maleic acid and the like, are used.

A nucleus can also be prepared by, in addition to the
10 above-mentioned, for example, a rolling granulation method in which a drug or a mixture of a drug with an excipient, lubricant and the like is added portionwise onto an inert carrier particle which is the core of the nucleus while spraying a binder dissolved in a suitable solvent such as water,
15 lower alcohol (e.g., methanol, ethanol and the like) and the like, a pan coating method, a fluidized bed coating method or a melt granulating method. As the inert carrier particle, for example, those made of sucrose, lactose, starch, crystalline cellulose, waxes can be used, and the average particle size
20 thereof is preferably from about 100 μm to about 1500 μm .

For separating a drug and a film agent contained in a nucleus, the surface of the nucleus may be coated with a protective agent. As the protective agent, for example, the above-mentioned hydrophilic substances, water-insoluble
25 substances and the like are used. As the protective agent, preferably polyethylene glycol, and polysaccharides having a hydroxyalkyl group or carboxyalkyl group are used, more preferably, hydroxypropylmethylcellulose and hydroxypropylcellulose are used. The protective agent may
30 contain, as a stabilizer, acids such as tartaric acid, citric acid, succinic acid, fumaric acid, maleic acid and the like, and lubricants such as talc and the like. When the protective agent is used, the coating amount is from about 1 to about 15% (w/w), preferably from about 1 to about 10% (w/w), further

preferably from about 2 to about 8% (w/w), based on the nucleus.

The protective agent can be coated by a usual coating method, and specifically, the protective agent can be spray coated on a nucleus by, for example, a fluidized bed coating
5 method, pan coating method and the like.

II. Coating of nucleus with film agent

A nucleus obtained in the above-mentioned step I is coated with a film agent solution obtained by heat-solving the
10 above-mentioned water-insoluble substance and pH-dependent swellable polymer, and a hydrophilic substance, or by dissolving or dispersing them in a solvent, to give a sustained release preparation.

As the method for coating a nucleus with a film agent
15 solution, for example, a spray coating method and the like are mentioned.

The composition ratio of a water-insoluble substance, swellable polymer and hydrophilic substance in a film agent solution is appropriately selected so that the contents of
20 these components in a coated film are the above-mentioned contents, respectively.

The coating amount of a film agent is from about 1 to about 90% (w/w), preferably from about 5 to about 50% (w/w), further preferably from about 5 to about 35% (w/w), based on a
25 nucleus (not including coating amount of protective agent).

As the solvent in a film agent solution, water or an organic solvent can be used alone or in admixture thereof. In the case of use in admixture, the mixing ratio of water to an organic solvent (water/organic solvent: by weight) can be
30 varied in the range from 1 to 100%, and preferably from 1 to about 30%. The organic solvent is not particularly restricted providing it dissolves a water-insoluble substance, and for example, lower alcohols such as methyl alcohol, ethyl alcohol, isopropyl alcohol, n-butyl alcohol and the like, lower alkanone

such as acetone and the like, acetonitrile, chloroform, methylene chloride and the like are used. Among them, lower alcohols are preferable, and ethyl alcohol and isopropyl alcohol are particularly preferable. Water, and a mixture of
5 water with an organic solvent are preferably used as a solvent for a film agent. In this case, if necessary, an acid such as tartaric acid, citric acid, succinic acid, fumaric acid, maleic acid and the like may also be added into a film agent solution for stabilizing the film agent solution.

10 An operation of coating by spray coating can be effected by a usual coating method, and specifically, it can be effected by spray-coating a film agent solution onto a nucleus by a fluidized bed coating method, pan coating method and the like. In this case, if necessary, talc, titanium oxide, magnesium
15 stearate, calcium stearate, light anhydrous silicic acid and the like may also be added as a lubricant, and glycerin fatty acid ester, hardened castor oil, triethyl citrate, cetyl alcohol, stearyl alcohol and the like may also be added as a plasticizer.

20 After coating with a film agent, if necessary, an antistatic agent such as talc and the like may be mixed.

The quick release preparation may be liquid (e.g., solution, suspension, emulsion and the like) or solid (e.g., particle, pill, tablet and the like). As the quick release
25 preparation, oral agents and parenteral agents such as an injection and the like are used, and oral agents are preferable.

The quick release preparation, usually, may contain, in addition to an active component drug, also carriers, additives and excipients conventionally used in the production field
30 (hereinafter, sometimes abbreviated as excipient). The excipient used is not particularly restricted providing it is an excipient ordinarily used as a preparation excipient. For example, as the excipient for an oral solid preparation, lactose, starch, corn starch, crystalline cellulose (Avicel

PH101, manufactured by Asahi Chemical Industry Co., Ltd., and the like), powder sugar, granulated sugar, mannitol, light anhydrous silicic acid, magnesium carbonate, calcium carbonate, L-cysteine and the like are mentioned, and preferably, corn starch and mannitol and the like are mentioned. These excipients can be used alone or in combination of two or more. The content of the excipient is, for example, from about 4.5 to about 99.4% (w/w), preferably from about 20 to about 98.5% (w/w), further preferably from about 30 to about 97% (w/w), based on the total amount of the quick release preparation.

The content of a drug in the quick release preparation can be appropriately selected in the range from about 0.5 to about 95% (w/w), preferably from about 1 to about 60% (w/w) based on the total amount of the quick release preparation.

When the quick release preparation is an oral solid preparation, it usually contains, in addition to the above-mentioned components, also a disintegrant. As this disintegrant, there are used, for example, carboxymethylcellulose calcium (ECG-505, manufactured by Gotoku Yakuhin), crosscarmellose sodium (e.g., Ac-Di-Sol, manufactured by Asahi Chemical Industry Co., Ltd.), Crospovidone (e.g., Kollidon CL, manufactured by BASF), low-substituted hydroxypropylcellulose (manufactured by Shin-Etsu Chemical Co., Ltd.), carboxymethylstarch (manufactured by Matsutani Kagaku K.K.), carboxymethylstarch sodium (Exprotab, manufactured by Kimura Sangyo), partially pregelatinized starch (PCS, manufactured by Asahi Chemical Industry Co., Ltd.), and the like are used, and for example, those which disintegrate a granule by adsorbing water in contact with water, causing swelling, or making a channel between an effective ingredient constituting the nucleus and an excipient, can be used. These disintegrants can be used alone or in combination of two or more. The amount of the disintegrant used is appropriately selected depending on the kind and compounding amount of a drug

used, design of releasing property, and the like, and for example, from about 0.05 to about 30% (w/w), preferably from about 0.5 to about 15% (w/w), based on the total amount of the quick releasing agent.

5 When the quick release preparation is an oral solid preparation, it may further contain, in addition to the above-mentioned composition, if desired, additives conventional in solid preparations. As such an additive, there are used, for example, a binder (e.g., sucrose, gelatin, gum Arabic powder,
10 methylcellulose, hydroxypropylcellulose, hydroxypropylmethylcellulose, carboxymethylcellulose, polyvinylpyrrolidone, pullulan, dextrin and the like), a lubricant (e.g., polyethylene glycol, magnesium stearate, talc, light anhydrous silicic acid (e.g., aerosil (Nippon Aerosil)),
15 a surfactant (e.g., anionic surfactants such as sodium alkylsulfate and the like, nonionic surfactants such as polyoxyethylene fatty acid ester and polyoxyethylene sorbitan fatty acid ester, polyoxyethylene castor oil derivatives and the like), a coloring agent (e.g., tar pigment, caramel, iron
20 oxide red, titanium oxide, riboflavins, and the like), if necessary, an appetizing agent (e.g., sweetening agent, aroma and the like), an adsorbing agent, preservative, wetting agent, antistatic agent, and the like. Further, as the stabilizer, an organic acid such as tartaric acid, citric acid, succinic acid,
25 fumaric acid and the like may also be added.

As the above-mentioned binder, hydroxypropylcellulose, polyethylene glycol and polyvinylpyrrolidone and the like are preferably used.

The quick releasing preparation can be prepared by, based
30 on a usual technology of producing preparations, mixing the above-mentioned components, and if necessary, further kneading the mixture, and molding it. The above-mentioned mixing is conducted by generally used methods, for example, mixing, kneading and the like. Specifically, when a quick release

preparation is formed, for example, into a particle, it can be prepared, according to the same methods as in the above-mentioned method for preparing a nucleus of a sustained release preparation, by mixing the components using a vertical
5 granulator, universal kneader (manufactured by Hata Tekkosho), fluidized bed granulator FD-5S (manufactured by Powrex), and the like, then, subjecting the mixture to a wet extrusion granulation method, fluidized bed granulation method and the like.

10 Thus obtained quick releasing preparation and sustained releasing preparation may be themselves made into products or made into products appropriately together with preparation excipients and the like, separately, by an ordinary method, then, may be administered simultaneously or may be administered
15 in combination at any administration interval, or they may be themselves made into one oral preparation (e.g., granule, fine particle, tablet, capsule and the like) or made into one oral preparation together with preparation excipients and the like. It may also be permissible that they are made into granules or
20 fine particles, and filled in the same capsule to be used as a preparation for oral administration.

[3] Sublingual, buccal or intraoral quick disintegrating agent and preparation thereof

Sublingual, buccal or intraoral quick disintegrating
25 agents may be a solid preparation such as tablet and the like, or may be an oral mucosa membrane patch (film).

5 dispersible polymer, stabilizer, coloring agent, sweetening agent, preservative and the like may be mixed. The sublingual, buccal or intraoral quick disintegrating agent is obtained by mixing the above-mentioned components simultaneously or at a time interval, then subjecting the mixture to tablet-making
10 molding under pressure. For obtaining suitable hardness, it may also be permissible that the materials are moistened by using a solvent such as water, alcohol and the like if desired before and after the tablet making process, and after the molding, the materials are dried, to obtain a product.

20 and the like, and the resulted solution is cast, to give a film. Further, additives such as a plasticizer, stabilizer, antioxidant, preservative, coloring agent, buffer, sweetening agent and the like may also be added. For imparting suitable elasticity to the film, glycols such as polyethylene glycol,
25 propylene glycol and the like may be contained, or for enhancing adhesion of the film to an intraoral mucosa membrane lining, a bio-adhesive polymer (e.g., polycarbofil, carbopol) may also be contained. In the casting, a solution is poured on the non-adhesive surface, spread to uniform thickness
30 (preferably 10 to 1000 micron) by an application tool such as a doctor blade and the like, then, the solution is dried to form a film. It may be advantageous that thus formed film is dried at room temperature or under heat, and cut into given area.

Of course, since the dosage as described above varies depending on various conditions, amounts smaller than the above-mentioned dosage may sometimes be sufficient, further,

amounts over that range sometimes have to be administered.

The amount of the concomitant drug can be set at any value unless side effects are problematical. The daily dosage in terms of the concomitant drug differs depending on the severity,

5 Amino acid sequences substantially identical to the amino acid sequence presented by SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7 or SEQ ID NO:9 are amino acid sequences having about 85% or more homology, preferably about 90% or more homology, more preferably about 95% or more homology to the
10 amino acid sequences presented by SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7 or SEQ ID NO:9 .

As proteins containing amino acid sequences substantially identical to the amino acid sequence of this invention presented by SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7
15 or SEQ ID NO:9, for example, proteins that contain amino acid sequences that are substantially identical to the amino acid sequence presented by SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7 or SEQ ID NO:9 and have substantially the same activity as that of the amino acid presented by SEQ ID NO:1,
20 SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7 or SEQ ID NO:9 are preferred.

As to the substantially same activity, ligand-binding activity, signal transduction activity and the like are included. 'Substantially same' means that the quality of the
25 activity is same. Therefore, although it is preferable that the activities such as ligand-binding and signal transduction activities are equivalent (e.g. about 0.01- to 100-fold, preferably about 0.5- to 20-fold, more preferably about 0.5- to 2-fold), quantitative factors such as the level of activity and
30 the molecular weight of the protein may differ.

The activities such as the ligand-binding activity, signal transduction activity and the like can be determined according to methods known per se and, for example, these activities can be measured according to the method for screening described

below.

Proteins containing the following amino acid sequences are also used as GPR40: a) amino acid sequences presented by SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7 or SEQ ID NO:9 in which one, two, or more amino acids (preferably 1 - 30 amino acids, more preferably 1 - 10 amino acids, most preferably several (1 - 5) amino acids) are deleted, b) amino acid sequences presented by SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7 or SEQ ID NO:9 in which one, two, or more amino acids (preferably 1 - 30 amino acids, more preferably 1 - 10 amino acids, and most preferably several (1 - 5) amino acids) are added, c) amino acid sequences presented by SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7 or SEQ ID NO:9 in which one, two, or more amino acids (preferably 1 - 30 amino acids, more preferably 1 - 10 amino acids, and most preferably several (1 - 5) amino acids) are substituted by other amino acids; or d) a protein containing a combination of such amino acid sequences and the like.

GPR40 in the present specification is presented according to the conventional presentation manner of peptides: the left end presents the N terminal (amino terminal) and the right end presents the C terminal (carboxyl terminal). In GPR40s including GPR40 containing the amino acid sequence presented by SEQ ID NO:1, the C terminal may be any of a carboxyl group (-COOH), carboxylate (-COO⁻), amide (-CONH₂) and ester (-COOR_x).

For R_x in the esters, for example, a C₁₋₆ alkyl groups such as methyl, ethyl, n-propyl, isopropyl and n-butyl, for example, C₃₋₈ cycloalkyl groups such as cyclopentyl and cyclohexyl, for example, C₆₋₁₂ aryl groups such as phenyl and α -naphthyl, for example, C₇₋₁₄ aralkyl groups including phenyl-C₁₋₂ alkyl groups such as benzyl and phenethyl and α -naphthyl-C₁₋₂ alkyl groups such as α -naphthylmethyl are used, and pivaloyloxymethyl groups, which are commonly used for oral esters, is also used.

When the GPR40 has a carboxyl group (or carboxylate) at a

site other than the C terminal, GPR40 having an amidated or esterified carboxyl group are also included in GPR40 of this invention. For the ester form in this case, for example, the C-terminal esters described above are used.

5 Further, the GPR40 also includes proteins described above in which the amino group of the N-terminal methionine residue is protected by a protecting group (e.g. C₁₋₆ acyl group such as formyl group, C₂₋₆ alkanoyl group such as acetyl and the like, and the like), those in which the N-terminal is cleaved in vivo
10 and the glutamyl group produced is converted to pyroglutamate, those in which substituents on amino acid side chains in the molecule (e.g. -OH, -SH, amino group, imidazole group, indole group, guanidino group) are protected by appropriate protecting groups (e.g. C₁₋₆ acyl group such as formyl group, C₂₋₆ alkanoyl
15 group such as acetyl and the like, and the like), or complex proteins to which sugar chains are bound, that is glycoproteins.

As a specific example of GPR40, for example, mouse GPR40 containing an amino acid sequence presented by SEQ ID NO:1, rat GPR40 containing an amino acid sequence presented by SEQ ID
20 NO:3, human GPR40 containing an amino acid sequence presented by SEQ ID NO:5, cynomolgus GPR40 containing an amino acid sequence presented by SEQ ID NO:7, hamster GPR40 containing an amino acid sequence presented by SEQ ID NO:9 and the like are used. Of these, mouse GPR40, rat GPR40, cynomolgus GPR40 and
25 hamster GPR40 are novel proteins. Human GPR40 is a known protein described in WO2000-22129, Biochem Biophys Res Commun. 1997, Oct 20; 239 (2): 543-547.

For the partial peptides of GPR40 (hereinafter sometimes to be abbreviated as partial peptides), any partial peptide of
30 the GPR40 described above may be used. For example, among the protein molecules of GPR40, the region exposed to outside of the cell membrane having substantially identical receptor-binding activity is used.

Concretely, the partial peptides of GPR40 having amino

acid sequence presented by SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7 or SEQ ID NO:9 are peptides containing the regions that were shown to be the extracellular domains (hydrophilic regions) by the hydrophobicity plot analysis.

5 Part of peptides partially containing hydrophobic region may also be used. Peptides containing individual domains can be used, but peptides of a part containing multiple domains may also be used.

The number of amino acids in the partial peptides of this
10 invention is preferably peptide having at least 20 or more, preferably 50 or more, and more preferably 100 or more of the constitutive amino acid sequence of the receptor protein of this invention described above and the like.

The substantially identical amino acid sequences are amino
15 acid sequences that have about 85% or more, preferably about 90% or more, more preferably about 95% or more homology to these amino acid sequences.

Here, the 'substantially identical receptor activity' means the same definition as described above. The
20 'substantially identical receptor activity' can be measured as described above.

In the partial peptides of this invention, one, two, or more amino acids (preferably about 1 - 10 amino acids, more preferably several (1 - 5) amino acids) may be deleted, one,
25 two, or more amino acids (preferably about 1 - 20 amino acids, preferably about 1 - 10 amino acids, and more preferably several (1 - 5) amino acids) may be added, or one, two, or more amino acids (preferably about 1 - 10 amino acids, more preferably several amino acids, and most preferably about 1 - 5
30 amino acids) may be substituted by other amino acids.

In the partial peptides of this invention, the C-terminal may be any of carboxyl group (-COOH), carboxylate (-COO⁻), amide (-CONH₂) and ester (-COOR). When the partial peptide of the present invention has a carboxyl group (or carboxylate)

besides C-terminal, the partial peptide of the present invention also encompasses one wherein a carboxyl group is amidated or esterified. As the ester in this case, for example, an ester of the above-mentioned C-terminal and the like are
5 used.

The partial peptides of this invention include peptides in which the amino group of the N-terminal methionine residue is protected by a protecting group, those in which the N-terminal residue is cleaved in vivo and the glutamine residue is
10 converted to pyroglutamate, those in which substituents in amino acid side chains in the molecule are protected by appropriate protecting groups, or those in which sugar chains are bound, that is glycopeptides, as in the GPR40 mentioned above.

15 The salts of the GPR40 or partial peptides include physiologically acceptable salts formed with acids or bases, especially physiologically acceptable salts formed with acids are preferred. For examples, the salts formed with inorganic acids (e.g. hydrochloric acid, phosphoric acid, hydrobromic
20 acid, sulfuric acid) and the salts formed with organic acids (e.g. acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid, methanesulfonic acid, benzenesulfonic acid) are used.

25 The GPR40 and its salts can be manufactured by the methods known *per se* for purifying receptor protein from the human and mammalian cells or tissues described above. They may also be manufactured by culturing transformants containing the DNA encoding the GPR40 described below, and by the protein
30 synthesis method described below or the method analogous thereto.

When the receptor protein is produced from human or mammalian tissues or cells, human or mammalian tissues or cells are homogenized, followed by extracting with acid or the like,

and the extract is subjected to a combination of chromatography such as reverse-phase chromatography and ion-exchange chromatography to isolate and purify the receptor protein.

For the synthesis of GPR40 or a partial peptide thereof or
5 a salt thereof or an amide thereof, commercially available resins for protein synthesis can be used. Such resins include for example, chloromethyl resin, hydroxymethyl resin, benzhydrylamine resin, aminomethyl resin, 4-benzyloxybenzyl alcohol resin, 4-methylbenzhydrylamine resin, PAM resin, 4-
10 hydroxymethylmethyl phenyl acetoamidomethyl resin, polyacrylamide resin, 4-(2',4'-dimethoxyphenyl-hydroxymethyl)phenoxy resin, and 4-(2',4'-dimethoxyphenyl-Fmoc aminoethyl) phenoxy resin. Using these resins, amino acids in which the α -amino groups and the side-chain functional groups
15 are appropriately protected are condensed in the order of the sequence of the objective protein on the resin according to the various condensation methods known per se. At the end of the reaction, the protein is excised from the resin and the protecting groups are simultaneously removed. Then,
20 intramolecular disulfide bond-forming reaction is performed in a highly diluted solution to obtain the objective protein or its amide form.

For condensation of the protected amino acids described above, various activation reagents for protein synthesis can be
25 used, but carbodiimides are particularly good. For carbodiimides, DCC, N,N'-diisopropylcarbodiimide, and N-ethyl-N'-(3-dimethylaminopropyl)carbodiimide are used. For activation by these reagents, the protected amino acids are added with a racemization inhibitor (e.g. HOBt, HOObt) directly
30 to the resin, or the protected amino acids are previously activated as symmetric acid anhydrides, HOBt esters, or HOObt esters, then added to the resin.

The solvent used for activation of the protected amino acids and condensation with the resin can be appropriately

selected from solvents known to be useful in protein
condensation reaction. For example, acid amides such as N,N-
dimethylformamide, N,N-dimethylacetoamide, and N-
methylpyrrolidone, halogenated hydrocarbons such as methylene
5 hydrochloride and chloroform, alcohols such as trifluoroethanol,
sulfoxide such as dimethylsulfoxide, pyridine, ethers such as
dioxane and tetrahydrofuran, nitriles such as acetonitrile and
propionitrile, esters such as methyl acetate and ethyl acetate,
and appropriate mixtures of these solvents. The suitable
10 reaction temperature is appropriately selected from the range
known to be used in protein bonding reaction, and usually
appropriately selected from the range from about -20°C to 50°C.
The activated amino acid derivatives are usually used in 1.5-
to 4-fold excess. The condensation is tested using ninhydrin
15 reaction, and when the condensation is not sufficient,
sufficient condensation can be carried out by repeating the
condensation reaction without elimination of the protecting
groups. When sufficient condensation can not be obtained even
after repeating the reaction, non-reacted amino acids can be
20 acetylated using acetic anhydride or acetylimidazole.

For the protecting groups for amino group of raw material,
for examples, Z, Boc, tert-pentyloxycarbonyl,
isobornyloxycarbonyl, 4-methoxybenzyloxycarbonyl, Cl-Z, Br-Z,
adamantyloxycarbonyl, trifluoroacetyl, phthaloyl, formyl, 2-
25 nitrophenylsulfenyl, diphenylphosphinothioyl and Fmoc are used.

Carboxyl group can be protected by, for example, alkyl
esterification (straight-chain, branched and cyclic alkyl
esterification such as methyl, ethyl, propyl, butyl, tert-butyl,
cyclopentyl, cyclohexyl, cycloheptyl, cyclooctyl and 2-
30 adamantyl), aralkyl esterification (e.g. benzyl ester, 4-
nitrobenzyl ester, 4-methoxybenzyl ester, 4-chlorobenzyl ester,
benzhydryl ester), phenacyl esterification, benzyloxycarbonyl
hydrazidation, tert-butoxycarbonyl hydrazidation and trityl
hydrazidation.

The hydroxyl group of serine can be protected, for example, by esterification or etherification. Groups appropriate for this esterification include, for example, lower alkanoyl groups such as acetyl group, aroyl groups such as benzoyl group, and
5 groups derived from carbonic acid such as benzyloxycarbonyl group and ethoxycarbonyl group. In addition, groups appropriate for etherification include, for example, benzyl group, tetrahydropyranyl group, and t-butyl group.

As a protecting group of the phenolic hydroxyl group of
10 tyrosine, for example, Bzl, Cl₂-Bzl, 2-nitrobenzyl, Br-Z, and tert-butyl are used.

As a protecting group of the imidazole of histidine, for example, Tos, 4-methoxy-2,3,6-trimethylbenzenesulfonyl, DNP, benzyloxymethyl, Bum, Boc, Trt, and Fmoc are used.

15 As activated carboxyl groups in the raw material, for example, corresponding acid anhydride, azide, active ester [ester formed with alcohol (e.g. pentachlorophenol, 2,4,5-trichlorophenol, 2,4-dinitrophenol, cyanomethyl alcohol, paranitrophenol, HONB, N-hydroxysuccinimide, N-
20 hydroxyphthalimide, HOBt)] are used.

Activated amino groups in the raw material include, for example, corresponding phosphoric amide.

For the method for eliminating the protecting groups, for example, catalytic reduction in hydrogen gas flow in the
25 presence of a catalyst such as Pd-black and Pd-carbon, acid treatment with hydrogen fluoride anhydride, methanesulfonic acid, trifluoromethanesulfonic acid or trifluoroacetic acid, or mixture of these acids, basic treatment with diisopropylethylamine, triethylamine, piperidine and piperazine,
30 and reduction by sodium in liquid ammonia are used. The elimination reaction by the acid treatment described above is generally performed at a temperature ranging from about -20°C to 40°C. In acid treatment, addition of a cation scavenger such as anisole, phenol, thioanisole, m-cresol, p-cresol,

dimethylsulfide, 1,4-butanedithiol, and 1,2-ethanedithiol and the like is effective. 2,4-dinitrophenyl group used as the protecting group of the imidazole of histidine is removed by treatment with thiophenol. Formyl group used as the protecting
5 group of the indole of tryptophan is removed by the acid treatment in the presence of the aforementioned 1,2-ethanedithiol, 1,4-butanedithiol and the like, as well as alkaline treatment with diluted sodium hydroxide solution and diluted ammonia.

10 Protection of functional groups that should not be involved in the reaction of the raw materials, protecting groups, elimination of the protecting groups, and activation of functional groups involved in the reaction may be appropriately selected from known *per se* groups and means.

15 In another method for obtaining an amide form of protein, for example, first, the α -carboxyl group of the carboxy terminal amino acid is protected by amidation, and the peptide (protein) chain is extended for a desired length from the amino group side. Then, a protein in which only the protecting group
20 of the N-terminal α -amino group was removed from said peptide chain and a protein in which only the protecting group of the C-terminal carboxyl group is removed are produced. These two proteins are condensed in the mixed solvent as described above.

The details of the condensation reaction are the same as
25 described above. After the protected protein obtained by condensation is purified, all protecting groups are removed by the method described above, and the desired crude protein is obtained. The desired protein in amide form can be obtained by purifying this crude protein using various known means for
30 purification and by lyophilizing the major fraction.

To obtain esterified protein, for example, the α -carboxyl group of the carboxy terminal amino acid is condensed with a desired alcohol to prepare amino acid ester, and the desired esterified protein can be obtained by the same procedure as in

the preparation of the amide form of protein.

The partial peptides of GPR40 or their salts can be manufactured by a method for peptide synthesis known per se or by cleaving GPR40 with appropriate peptidase. For the method
5 for peptide synthesis, for example, either solid phase synthesis or liquid phase synthesis may be used. The partial peptides or amino acids that may compose GPR40 are condensed with the residual portion. When the product has protecting groups, the objective peptide can be produced by eliminating
10 the protecting groups. The condensation and elimination methods known per se include the methods described in a) - e) below.

After the reaction, the partial peptides of this invention are purified by a combination of conventional purification
25 methods for example, solvent extraction, distillation, column chromatography, liquid chromatography, recrystallization and the like. When the partial peptide obtained by the above methods is free form, it can be converted to an appropriate salt form by known methods. On the other hand, when a salt
30 form is obtained, it can be converted to the free form by known methods.

For the polynucleotide encoding GPR40, any polynucleotide containing the nucleotide sequence (DNA or RNA, preferably DNA) encoding GPR40 described above can be used. Said

polynucleotide may be DNA and RNA including mRNA encoding GPR40, which may be double-stranded or single-stranded. When the polynucleotide is double-stranded, it may be double-stranded DNA, double-stranded RNA, or DNA:RNA hybrid. When the
5 polynucleotide is single-stranded, it may be sense strand (i.e. coding strand) or antisense strand (i.e. non-coding strand).

Using the polynucleotide encoding GPR40, mRNA of GPR40 can be quantified by, for example, the known method described in separate volume of Jikken Igaku 15 (7) 'New PCR and its
10 application' (1997) or the method analogous thereto.

The DNA encoding GPR40 may be any DNA of genomic DNA, genomic DNA library, cDNA and cDNA library derived from the cells and tissues described above, and synthetic DNA. For the vector used for library, bacteriophage, plasmid, cosmid, and
15 phagemid may be used. The DNA may be directly amplified by Reverse Transcriptase Polymerase Chain Reaction (hereinafter to be abbreviated as RT-PCR) using total RNA or mRNA fraction prepared from the cells and tissues described above.

Concretely, the DNA encoding GPR40 may be, for example,
20 any DNA containing the nucleotide sequence presented by SEQ ID NO:2, SEQ ID NO:4, SEQ ID NO:6, SEQ ID NO:8 or SEQ ID NO:10 or DNA having the nucleotide sequence that hybridize to the nucleotide sequence presented by SEQ ID NO:2, SEQ ID NO:4, SEQ ID NO:6, SEQ ID NO:8 or SEQ ID NO:10 under a high stringent
25 condition, and encoding the receptor protein having substantially identical activity (e.g. ligand-binding activity and signal transduction activity) with that of GPR40 comprising the amino acid sequence presented by SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7 or SEQ ID NO:9.

30 For the DNA that can hybridize to the nucleotide sequence presented by SEQ ID NO:2, SEQ ID NO:4, SEQ ID NO:6, SEQ ID NO:8 or SEQ ID NO:10, for example, DNAs containing a nucleotide sequence that have about 85% or more homology, preferably about 90% or more homology, more preferably about 95% or more

homology to the nucleotide sequence presented by SEQ ID NO:2, SEQ ID NO:4, SEQ ID NO:6, SEQ ID NO:8 or SEQ ID NO:10 are used.

Hybridization can be performed using a method known *per se* or the method analogous thereto for example, the method
5 described in Molecular Cloning, 2nd (J. Sambrook et al., Cold Spring Harbor Lab. Press, 1989) and the like. When a commercial library is used, hybridization may be performed according to a method described in the attached instruction. Preferably, hybridization may be performed according to a high
10 stringent condition.

In said high stringent condition, for example, the sodium concentration is about 19 - 40 mM, preferably about 19 - 20 mM, and the temperature is about 50 - 70°C, preferably about 60 - 65°C. In the most preferred condition, the sodium concentration
15 is about 19 mM and the temperature is about 65°C.

More concretely, for the DNA encoding mouse GPR40 containing an amino acid sequence presented by SEQ ID:1, the DNAs encoding the nucleotide sequence presented by SEQ ID:2 are used.

20 As the DNA encoding mouse GPR40 containing an amino acid sequence presented by SEQ ID NO:3, a DNA containing a nucleotide sequence presented by SEQ ID NO:4 and the like are used.

As the DNA encoding mouse GPR40 containing an amino acid
25 sequence presented by SEQ ID NO:5, a DNA containing a nucleotide sequence presented by SEQ ID NO:6 and the like are used.

As the DNA encoding cynomolgus GPR40 containing an amino acid sequence presented by SEQ ID NO:7, a DNA containing a
30 nucleotide sequence presented by SEQ ID NO:8 and the like are used.

As the DNA encoding hamster GPR40 containing an amino acid sequence presented by SEQ ID NO:9, a DNA containing a nucleotide sequence presented by SEQ ID NO:10 and the like are

used.

The DNAs encoding the partial peptides of this invention may be any DNA that contains a nucleotide sequence encoding the aforementioned partial peptide of this invention, and may be
5 genomic DNA, genomic DNA library, cDNA and cDNA library derived from the cells and tissues described above, and synthetic DNA. Vectors used for library may be bacteriophage, plasmid, cosmid, and phagemid. The DNA may be directly amplified using a mRNA fraction prepared from the cells and tissues described above by
10 Reverse Transcriptase Polymerase Chain Reaction (hereinafter to be abbreviated as RT-PCR method).

Concretely, as the DNA encoding the partial peptides of this invention, for example: (1) DNA containing a partial nucleotide sequence of the DNA presented by SEQ ID NO:2, SEQ ID
15 NO:4, SEQ ID NO:6, SEQ ID NO:8 or SEQ ID NO:10, and (2) DNA containing a partial nucleotide sequence of the DNA that contains a nucleotide sequence that hybridizes to the nucleotide sequence presented by SEQ ID NO:2, SEQ ID NO:4, SEQ ID NO:6, SEQ ID NO:8 or SEQ ID NO:10 under a high stringent
20 condition and encoding a receptor protein having substantially identical activities (e.g., ligand binding activity, signal transduction activity and the like) with those of GPR40 having an amino acid sequence presented by SEQ ID NO:1, SEQ ID NO:3, SEQ ID NO:5, SEQ ID NO:7 or SEQ ID NO:9 and the like are used.

25 For the DNAs that hybridize to the nucleotide sequence presented by SEQ ID NO:2, SEQ ID NO:4, SEQ ID NO:6, SEQ ID NO:8 or SEQ ID NO:10, for example, DNAs containing about 85% or more, preferably about 90% or more, more preferably about 95% or more homology to the nucleotide sequence presented by SEQ ID NO:2,
30 SEQ ID NO:4, SEQ ID NO:6, SEQ ID NO:8 or SEQ ID NO:10 are used.

For the means for cloning the DNA completely encoding GPR40 or its partial peptides (hereinafter sometimes to be abbreviated as GPR40), the DNA is amplified by PCR using synthetic DNA primers containing a partial nucleotide sequence

of GPR40, or the DNA inserted in an appropriate vector can be selected by hybridization with the labeled DNA fragment encoding a part or entire region of GPR40 or synthetic DNA. Hybridization can be performed, for example, by the method
5 described in Molecular Cloning, 2nd (J. Sambrook et al., Cold Spring Harbor Lab. Press, 1989) and the like. Hybridization can also be performed when a commercial library is used according to the method described in the attached instruction.

Conversion of the DNA nucleotide sequences can be
10 performed by PCR or methods known per se such as ODA-LA PCR, Gapped duplex method and Kunkel method or methods analogous thereto using a known kit such as MutanTM-super Express Km (TAKARA SHUZO CO., LTD.), MutanTM-K (TAKARA SHUZO CO., LTD.) and the like.

15 The cloned DNAs encoding GPR40 can be used without treatment or used after digestion with restriction enzymes or addition of linkers when desired. Said DNA may contain the translational initiation codon ATG at the 5'-end and translational stop codon TAA, TGA, or TAG at the 3'-end. These
20 translational initiation codon and stop codon can be added using an appropriate synthetic DNA adaptor.

Expression vectors for GPR40 can be manufactured, for example, as follows: (i) The objective DNA fragment is excised from the DNA encoding GPR40, and (ii) the DNA fragment is
25 ligated to downstream of the promoter in an appropriate vector.

For the vector, *Escherichia coli*-derived plasmid (e.g. pBR322, pBR325, pUC12, pUC13), *Bacillus subtilis*-derived plasmid (e.g. pUB110, pTP5, pC194), yeast-derived plasmid (e.g. pSH19, pSH15), bacteriophages such as λ phage, animal viruses
30 such as retrovirus, vaccinia virus, baculovirus, and pA1-11, pXT1, pRC/CMV, pRC/RSV, and pcDNAI/Neo are used.

Any promoter that is appropriate and corresponds to the host used for the gene expression may be used as the promoter used in this invention. For example, when animal cells are

used as the host, SR α promoter, SV40 promoter, LTR promoter, CMV promoter, and HSV-TK promoter are used.

Among them, CMV promoter and SR α promoter are preferred. When the host is bacteria of *Escherichia* genus, trp promoter, 5 lac promoter, recA promoter, λ P_L promoter, and lpp promoter and the like are preferred. When the host is bacteria of *Bacillus* genus, SPO1 promoter, SPO2 promoter, penP promoter and the like are preferred. When the host is yeast, PHO5 promoter, PGK promoter, GAP promoter, ADH promoter and the like are preferred. 10 When the host is insect cells, polyhedrin promoter, P10 promoter and the like are preferred.

In addition to the vectors described above, expression vectors containing enhancer, splicing signal, polyA addition signal, selection marker, and SV40 replication origin 15 (hereinafter sometimes to be abbreviated as SV40ori) may be used when desired. For the selection marker, for example, dihydrofolate reductase (hereinafter sometimes to be abbreviated as dhfr) gene [methotrexate (MTX)-resistant], ampicillin resistance gene (hereinafter to be abbreviated as 20 Amp^r), and neomycin resistance gene (hereinafter sometimes to be abbreviated as Neo^r, G418 resistant) are used. Especially, when dhfr gene is used as a selection marker using CHO (dhfr⁻) cells, the objective gene can be selected using a thymidine-free medium.

25 Where necessary, moreover, a signal sequence appropriate for the host is added to the N-terminal of the receptor protein of this invention. When the host is bacteria of *Escherichia* genus, PhoA signal sequence and OmpA signal sequence and the like are used. When the host is bacteria of *Bacillus* genus, α - 30 amylase signal sequence and subtilisin signal sequence and the like are used. When the host is yeast, MF α signal sequence and SUC2 signal sequence are used. When the host is animal cells, insulin signal sequence, α -interferon signal sequence, and the signal sequence of antibody molecule and the like can be used.

Using the vectors containing the DNA encoding GPR40 constructed as described above, transformants can be manufactured.

When the virus is BmNPV, silkworm-derived cells *Bombyx mori* N (BmN cells) are used. For said Sf cells, for example, SF9 cells (ATCC CRL1711), Sf21 cells (Vaughn, J.L. et al., In Vivo 13, 213-217 (1977)) are used.

30 For the host of insect, for example, silkworm larvae are used [Maeda et al., Nature, Vol. 315, 592 (1985)].

Bacteria of *Escherichia* genus can be transformed according to, for example, the methods described in Proc. Natl. Acad. Sci. USA Vol. 69, 2110 (1972) and Gene Vol. 17, 107 (1982) and the like.

Bacteria of *Bacillus* genus can be transformed according to, for example, the method described in Molecular & General Genetics Vol. 168, 111 (1979) and the like.

Yeast can be transformed according to, for example, the methods described in Methods in Enzymology Vol. 194, 182-187 (1991) and Proc. Natl. Acad. Sci. USA Vol. 75, 1929 (1978) and the like.

Insect cells and insects can be transformed according to, for example, the method described in Bio/Technology, 6, 47-55 (1988) and the like.

Animal cells can be transformed by, for example, the methods described in Cell Engineering (Saibo Kogaku) Separate Vol. 8, New Cell Engineering Experimental Protocol, 263-267 (1995) (Shujun-sha) and Virology Vol. 52, 456 (1973).

As described above, the transformants transformed by the expression vector containing the DNA encoding GPR40 can be obtained.

For the medium for culturing the transformants wherein the host is *Escherichia* or *Bacillus* host, liquid medium is suitable, in which carbon source, nitrogen source, inorganic compounds, and other substances necessary for the growth of the transformants are contained. The carbon source includes for example, glucose, dextrin, soluble starch, sucrose and the like.

The nitrogen source includes for example, inorganic and organic compounds such as ammonium salts, nitrates, corn steep liquor, peptone, casein, meat extract, soybean cake, potato extract and the like. The inorganic compounds include for

example, calcium chloride, sodium dihydrogen phosphate, magnesium chloride and the like. Yeast extract, vitamins, and growth factors may be added. The pH of about 5 - 8 is desirable for the culture.

5 For the culture medium for bacteria of *Escherichia* genus, for example, M9 medium containing glucose and casamino acids (Miller, Journal of Experiments in Molecular Genetics, 431-433, Cold Spring Harbor Laboratory, New York, 1972) is preferred. When more efficiency is required for the function of the
10 promoter, reagent such as 3 β -indolyl acrylate may be added.

When the host is bacteria of *Escherichia* genus, the bacteria are generally cultured at about 15 - 43°C for about 3 - 24 hours, and aeration or agitation may be added to the culture, when necessary.

15 When the host is bacteria of *Bacillus* genus, the bacteria are generally cultured at about 30 - 40°C for about 6 - 24 hours, and aeration or agitation may be added to the culture, when necessary.

For the medium for culturing the transformant of yeast
20 host, for example, Burkholder minimum medium [Bostian, K.L. et al., Proc. Natl. Acad. Sci. USA Vol. 77, 4505 (1980)] and SD medium containing 0.5% casamino acid [Bitter, G.A. et al., Proc. Natl. Acad. Sci. USA Vol. 81, 5330 (1984)] are used. The pH of the medium is preferably adjusted to about 5 - 8. The
25 culture are generally performed at about 20 - 35°C for about 24 - 72 hours, and aeration or agitation may be added to the culture, when necessary.

When transformants of insect cell host or insect host are cultured, Grace's insect medium (Grace, T.C.C., Nature, 195,
30 788 (1962)) containing appropriate supplements such as inactivated 10% bovine serum is used as a medium. The pH of the medium is preferably adjusted to about 6.2 - 6.4. Usually, the culture is performed at 27°C for about 3 - 5 days, and aeration or agitation may be added to the culture, when

necessary.

When the transformants of animal cell host are cultured, for example, MEM medium containing about 5 - 20% fetal calf serum [(Science Vol. 122, 501 (1952)), DMEM medium [Virology
5 Vol. 8, 396 (1959)], RPMI 1640 medium [The Journal of the American Medical Association vol. 199, 519 (1967)], 199 medium [Proceeding of the Society for the Biological Medicine Vol. 73, 1 (1950)] and the like are used as the medium. The pH is preferably adjusted to about 6 - 8. Usually, the culture is
10 performed at about 30 - 40°C for about 15 - 60 hours, and aeration or agitation may be added to the culture, when necessary.

As described above, GPR40 can be produced intracellularly, on cell membrane or extracellularly of the transformants.

15 GPR40 can be purified from the culture described above by, for example, the methods described below.

When GPR40 is extracted from the cultured bacteria or cells, the bacteria or cells are collected after culture by a known method, and suspended in appropriate buffer. The
20 bacteria or cells are then disrupted using ultrasonication, lysozymes, and/or by freezing-thawing and the like, and the crude extract of GPR40 is obtained by centrifugation or filtration. The buffer may contain protein-denaturants such as urea and guanidine hydrochloride and a surfactant such as
25 Triton X-100™. When GPR40 is secreted into the culture supernatant, the supernatant is separated from the bacteria or cells after the completion of culture and collected using a method known *per se*.

For purification of GPR40 from the culture supernatant or
30 the extract obtained as described above, methods known *per se* for separation and purification can be appropriately combined. These methods known *per se* for separation and purification include methods using solubility such as salting out and solvent precipitation, methods mainly using differences in

molecular weight such as dialysis, ultrafiltration, gel
filtration, and SDS-polyacrylamide gel electrophoresis, methods
using differences in electric charge such as ion-exchange
chromatography, methods using specific affinity such as
5 affinity chromatography, methods using differences in
hydrophobicity such as reverse-phase high performance liquid
chromatography, methods using differences in isoelectric point
such as isoelectric focusing and the like.

When GPR40 thus obtained is in a free form, the free form
10 can be converted to salts by methods known *per se* or methods
analogous thereto. Conversely, when GPR40 is obtained in a
salt form, the salt form can be converted to the free form or
other salts by methods known *per se* or methods analogous
thereto.

15 GPR40 produced by transformants can be optionally modified
or partially removed a polypeptide from GPR40 by treating GPR40
with an appropriate protein-modifying enzyme before or after
purification. For the protein-modifying enzyme, for example,
trypsin, chymotrypsin, arginylendopeptidase, protein kinase,
20 glycosidase and the like are used.

The activity of GPR40 thus produced can be measured by
binding assay using labeled ligands and by enzyme immunoassay
using specific antibody and the like.

25 In the following, a screening method for a compound that
changes the bindability between GPR40 and fatty acid, which is
a physiological ligand thereof (i.e., other ligand to GPR40,
GPR40 agonist, GPR40 antagonist and the like) is described in
detail.

30 As mentioned above, since the compound of the present
invention has a GPR40 activating activity, GPR40 ligand,
agonist or antagonist can be efficiently screened for from the
test compound by the use of a binding assay system using GPR40
(including cells expressing recombinant or endogenous GPR40,

cell membrane fraction thereof and the like) and the compound of the present invention as a surrogate ligand.

The GPR40 ligand and agonist are physiological and non-physiological compounds that bind with GPR40 to show a cell stimulating activity (hereinafter to be generally referred to as "GPR40 agonist").

As the cell stimulating activity, for example, an activity promoting or suppressing arachidonic acid release, acetylcholine release, intracellular Ca^{2+} release, intracellular cAMP production, intracellular cGMP production, inositol phosphate production, cell membrane potential variation, phosphorylation of intracellular protein, c-fos activation, pH reduction and the like, and the like, particularly intracellular Ca^{2+} concentration increasing activity and intracellular cAMP production suppressing activity can be mentioned.

The GPR40 antagonist is a compound that binds with GPR40 but does not show a cell stimulating activity, or shows an activity reverse to the cell stimulating activity (reverse activating activity). In the present specification, therefore, the "GPR40 antagonist" is used as a concept encompassing not only what is called neutral antagonists but also inverse agonists.

In addition, by the screening method of the present invention, a compound that potentiates binding force of fatty acid and GPR40, or a compound that decreases the binding force of fatty acid and GPR40 and the like can be screened for.

That is, the present invention provides a screening method of a GPR40 agonist or a GPR40 antagonist, which comprises comparing (i) when GPR40 and the compound of the present invention are brought into contact and (ii) when GPR40, the compound of the present invention and a test compound are brought into contact.

The screening method of the present invention is

characterized in that, for example, binding amount, cell stimulating activity and the like of the compound of the present invention relative to GPR40 in the cases of (i) and (ii) are determined and compared.

- 5 More specifically, the present invention provides
- a) a screening method of GPR40 agonist or GPR40 antagonist, which is characterized in that the amounts of the labeled compound of the present invention bound to GPR40 in the cases of when a labeled compound of the present invention is brought
10 into contact with GPR40 and when a labeled compound of the present invention and a test compound are brought into contact with GPR40 are determined and compared,
- b) a screening method of GPR40 agonist or GPR40 antagonist, which is characterized in that the amounts of the labeled
15 compound of the present invention bound to a cell or a membrane fraction in the cases of when a labeled compound of the present invention is brought into contact with the cell containing GPR40 or the membrane fraction of the cell and when a labeled compound of the present invention and a test
20 compound are brought into contact with the cell containing GPR40 or the membrane fraction of the cell are determined and compared,
- c) a screening method of GPR40 agonist or GPR40 antagonist, which is characterized in that the amount of the labeled
25 compound of the present invention bound to GPR40 in the cases of when a labeled compound of the present invention is brought into contact with GPR40 expressed on a cell membrane by culture of a transformant containing GPR40 DNA and when a labeled compound of the present invention and a test compound
30 are brought into contact with GPR40 expressed on a cell membrane by culture of a transformant containing GPR40 DNA are determined and compared,
- d) a screening method of GPR40 agonist or GPR40 antagonist, which is characterized in that the cell stimulating activity

via GPR40 in cells containing GPR40 are determined in the presence or absence of a test compound and compared,
e) a screening method of GPR40 agonist or GPR40 antagonist, which is characterized in that the cell stimulating activity
5 via GPR40 expressed on a cell membrane by culture of a transformant containing GPR40 DNA are determined in the presence or absence of a test compound and compared,
f) a screening method of GPR40 agonist or GPR40 antagonist, which is characterized in that the cell stimulating activity
10 via GPR40 in the cases of when a compound of the present invention is brought into contact with a cell containing GPR40 and when a compound of the present invention and a test compound are brought into contact with a cell containing GPR40 are determined and compared, and
15 g) a screening method of GPR40 agonist or GPR40 antagonist, which is characterized in that the cell stimulating activity via GPR40 in the cases of when a compound of the present invention is brought into contact with GPR40 expressed on a cell membrane by culture of a transformant containing GPR40
20 DNA and when a compound of the present invention and a test compound are brought into contact with GPR40 expressed on a cell membrane by culture of a transformant containing GPR40 DNA are determined and compared.

Since the compound of the present invention can be easily
25 labeled as compared to fatty acid which is a natural ligand, it is suitable for screening.

As the test compound, for example, peptide, protein, non-peptidic compound, synthetic compound, fermentation product, cell extract, plant extract, animal tissue extract and the
30 like are used and these compounds may be novel compounds or known compounds.

The test compound may form a salt, and as the salt of the test compound, salts with physiologically acceptable acid (e.g., inorganic acid and the like), base (e.g., organic acid

and the like) and the like are used, and physiologically acceptable acid addition salts are particularly preferable. As such salts, for example, salts with inorganic acid (e.g., hydrochloric acid, phosphoric acid, hydrobromic acid, sulfuric acid and the like), salts with organic acid (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid, methanesulfonic acid, benzenesulfonic acid and the like) and the like are used.

10 As the test compound, a compound designed to bind with a ligand binding pocket, based on the atomic coordinate of the active site of GPR40 and the site of ligand binding pocket, is preferably used. The atomic coordinate of the active site of GPR40 and the site of ligand binding pocket can be determined
15 by a known method or a method analogous thereto.

The screening method of the present invention is concretely described in the following.

First, GPR40 to be used for the screening method of the
20 present invention may be any as long as it contains the above-mentioned GPR40, but a cell membrane fraction of an organ of a mammal containing GPR40 is preferable. Particularly, however, since a human-derived organ is extremely difficult to obtain, human-derived GPR40 expressed in large amounts using a
25 recombinant and the like are suitable for screening.

To manufacture GPR40, the methods described above are used, and it is preferred to express GPR40 DNA in mammalian and insect cells. For the DNA fragment encoding the objective protein region, the complementary DNA, but not necessarily
30 limited thereto, is employed. For example, the gene fragments and synthetic DNA may also be used. To introduce a GPR40 DNA fragment into host animal cells and efficiently express the DNA there, it is preferred to insert the DNA fragment downstream of a polyhedrin promoter of nuclear polyhedrosis virus (NPV)

belonging to baculovirus hosted by insects, SV40-derived promoter, retrovirus promoter, metallothionein promoter, human heat shock promoter, cytomegalovirus promoter, SR α promoter and the like. The amount and quality of the expressed receptor
5 protein are examined by methods known per se, for example, the method described in the literature [Nambi, P. et al., The Journal of Biological Chemistry (J. Biol. Chem.), 267, 19555-19559, 1992].

Therefore, in the screening method of the present
10 invention, as a material that contains GPR40, GPR40 purified by methods known per se or cells containing said GPR40 may be used. In addition, a membrane fraction of cells containing GPR40 may be used.

In the screening method of the present invention, when
15 cells containing GPR40 are used, the cells may be fixed with glutaraldehyde, formalin, etc. The cells can be fixed by a method known per se.

The cells containing GPR40 are host cells that express said GPR40. For the host cells, *Escherichia coli*, *Bacillus*
20 *subtilis*, yeast, insect cells, animal cells and the like are preferred.

The cell membrane fraction is a fraction containing the abundant cell membrane obtained after disruption of the cells by a method known per se. The cell disruption methods include
25 crushing the cells using a Potter-Elvehjem homogenizer, disruption using a Waring blender or polytron (Kinematica Co.), disruption by ultrasonication, and disruption by passing the cells through a narrow nozzle with compressing the cells using a French Press. For the cell membrane fractionation method,
30 fractionation based on centrifugal force such as centrifugation for fractionation and density gradient centrifugation are mainly used. For example, disrupted cell suspension is centrifuged at a low speed (500 - 3,000 rpm) for a short time (usually about 1 - 10 minutes), the supernatant is then

centrifuged at a high speed (15,000 - 30,000 rpm) for usually 30 minutes - 2 hours, and the obtained precipitate is used as the membrane fraction. The membrane fraction contains many membrane components such as the expressed GPR40, and
5 phospholipids and membrane proteins derived from the cells.

The amount of GPR40 in the cells and membrane fractions containing GPR40 is preferably 10^3 - 10^8 molecules and suitably 10^5 - 10^7 molecules per cell. A higher expression amount enhances ligand binding activity (specific activity) per
10 membrane fraction, which makes not only construction of a highly sensitive screening system but also assay of a large amount of specimen in a single lot possible.

To perform the above-mentioned a)- c) for screening for a GPR40 agonist or antagonist, for example, a suitable GPR40
15 fraction and a labeled compound of the present invention are necessary.

As the GPR40 fraction, natural type GPR40 fraction, a recombinant type GPR40 fraction having an activity equivalent thereto and the like are desirable. Here, the equivalent
20 activity means the same level of ligand binding activity, signal transduction activity and the like.

As the labeled compound of the present invention, for example, a compound of the present invention labeled with radioisotope such as [^3H], [^{125}I], [^{14}C], [^{35}S] or the like,
25 fluorescence substance, enzyme or the like, or the like is used.

Concretely, to perform screening for a GPR40 agonist or antagonist, firstly, GPR40 specimen is prepared by suspending the cells or cell membrane fraction containing GPR40 into
30 buffer appropriate for the screening. For the buffer, any buffer that does not inhibit the binding of ligands to GPR40 such as phosphate buffer and Tris-hydrochloride buffer and the like having pH 4 - 10 (preferably pH 6 - 8) can be used. To reduce non-specific binding, a surfactant such as CHAPS,

Tween-80TM (Kao-Atras Co.), digitonin, deoxycholate and the like may be added to the buffer. Further, to inhibit degradation of GR40 and the test compound (peptidic compound) by proteases, protease inhibitors such as PMSF, leupeptin, E-
5 64 (Peptide Research Laboratory, Co.), and pepstatin may be added. To 0.01 - 10 ml of the receptor protein solution, a specified amount (5,000 - 500,000 cpm) of labeled ligand is added so that 10^{-4} M to 10^{-10} M of the test compound can be exist simultaneously. To examine the amount of non-specific
10 binding (NSB), reaction tubes containing a highly excessive amount of non-labeled compound of the present invention are also prepared. The reaction is performed at about 0°C - 50°C, preferably about 4°C - 37°C, for about 20 minutes - 24 hours, preferably for about 30 minutes - 3 hours. After the reaction,
15 the reaction solution is filtered through a glass fiber filter and the like and the filter was washed with an appropriate amount of the buffer. The radioactivity remaining on the glass fiber filter is measured using a liquid scintillation counter or γ -counter. A test compound showing a specific
20 binding amount (B-NSB) of, for example, not more than 50%, wherein a count (B_0 -NSB) obtained by subtracting a non-specific binding amount (NSB) from a count (B_0) free of antagonistic substance is taken as 100%, can be selected as a candidate substance having an antagonistic inhibitory ability.

25 To perform the above-mentioned d)- g) of screening for a GPR40 agonist or antagonist, GPR40 mediated cell stimulating activity (e.g. activity promoting or suppressing arachidonic acid release, acetylcholine release, intracellular Ca^{2+} release, intracellular cAMP production, intracellular cGMP production,
30 inositol phosphate production, cell membrane potential variation, phosphorylation of intracellular protein, c-fos activation, pH reduction and the like, particularly intracellular Ca^{2+} concentration increasing activity and intracellular cAMP production suppressing activity) can be

measured using method known *per se* or commercial assay kits.

Concretely, first, cells containing GPR40 are cultured in multiwell plates and the like. Before screening, the medium is exchanged to fresh medium or an appropriate buffer that
5 exhibits no toxicity for the cells. After the cells are incubated by adding a test compound and the like for a specified time, the cells are extracted or the supernatant is collected, and the product is quantified according to the corresponding method. When detection of the production of a
10 substance (e.g., Ca^{2+} , cAMP and the like) to be used as an index of cell stimulating activity is difficult due to catabolic enzymes contained in the cell, an inhibitor of the catabolic enzymes may be added before assay. As regards the activity of cAMP production inhibition and the like, it can be
15 detected as a production inhibitory action on the cell made to show increased basic production amount with forskolin and the like.

To perform screening by determining the cell stimulating activity, the cells expressing suitable GPR40 are necessary.
20 As the cells expressing GPR40, cell lines having natural type GPR40, cell lines expressing the above-mentioned recombinant type GPR40 and the like are desirable.

A specific evaluation method to determine whether the compound obtained by screening is a GPR40 agonist or a GPR40
25 antagonist comprises the following (i) or (ii).

(i) Using the screening method of the aforementioned a)- c), a compound that changes the bindability of the compound of the present invention and GPR40 (particularly, binding is inhibited) or a salt thereof is obtained, and whether the
30 compound or a salt thereof has the above-mentioned cell stimulating activity or not is determined. The compound having said cell stimulating activity or a salt thereof is an agonist and the compound free of said cell stimulating activity or a salt thereof is an antagonist.

(ii) (a) A test compound is brought into contact with a cell containing GPR40 and the above-mentioned cell stimulating activity is determined. A test compound having said cell stimulating activity is an agonist of GPR40.

5 (b) The cell stimulating activity when the compound of the present invention is brought into contact with a cell containing GPR40 and when the compound of the present invention and a test compound are brought into contact with a cell containing GPR40 are determined and compared. A test
10 compound capable of decreasing the cell stimulating activity of the compound of the present invention is an antagonist of GPR40.

More specifically, the evaluation criterion described in Example 202 can be used.

15

The screening kit for GPR40 agonist or GPR40 antagonist comprises the compound of this invention, GPR40, a cell containing GPR40 or a membrane fraction of a cell containing GPR40 and the like.

The screening method of the present invention is characterized by screening for a GPR40 agonist or GPR40 antagonist using, as a surrogate ligand, the compound of the present invention screened using GPR40 and its endogenous
5 ligand, fatty acid. Use of such synthetic ligand is advantageous as compared to screening using an endogenous ligand, which is a naturally occurring substance, in that labeling of the ligand is easy and the screening can be performed efficiently.

10 The compound obtained by the screening method or screening kit of the present invention, and a salt thereof are GPR40 agonists or GPR40 antagonists.

The GPR40 agonist and GPR40 antagonist obtained using the screening method or screening kit of the present invention may
15 form a salt, and as such salt, salts with physiologically acceptable acids (e.g., inorganic acid and the like), base (e.g., organic acid and the like) and the like are used, physiologically acceptable acid addition salts are particularly preferable. As such salts, for example, salts
20 with inorganic acid (e.g., hydrochloric acid, phosphoric acid, hydrobromic acid, sulfuric acid and the like), salts with organic acid (e.g., acetic acid, formic acid, propionic acid, fumaric acid, maleic acid, succinic acid, tartaric acid, citric acid, malic acid, oxalic acid, benzoic acid,
25 methanesulfonic acid, benzenesulfonic acid and the like) and the like are used.

Since GPR40 agonist has a physiological activity similar to that of fatty acid, which is a ligand to GPR40, it is useful as a safe and low toxic pharmaceutical agent according
30 to the physiological activity of the fatty acid.

Since GPR40 antagonist can inhibit the physiological activity of fatty acid, which is a ligand to GPR40, it is useful as a safe and low toxic pharmaceutical agent to suppress the physiological activity of fatty acid.

Since a compound that potentiates the binding force between fatty acid and GPR40 can potentiate the physiological activity of fatty acid, which is a ligand to GPR40, it is useful as a safe and low toxic pharmaceutical agent according
5 to the physiological activity of the fatty acid.

Since a compound that decreases the binding force between fatty acid and GPR40 can decrease the physiological activity of fatty acid, which is a ligand to GPR40, it is useful as a safe and low toxic pharmaceutical agent to suppress the
10 physiological activity of fatty acid.

Specifically, the (i) GPR40 agonist and (ii) compound potentiating the binding force between fatty acid and GPR40 or a salt thereof, which are obtained using the screening method or screening kit of the present invention, are useful as an
15 agent for the prophylaxis or treatment of, for example, diseases such as diabetes, impaired glucose tolerance, ketosis, acidosis, diabetic neuropathy, diabetic nephropathy, diabetic retinopathy, hyperlipidemia, genital disorder, skin disease, arthropathy, osteopenia, arteriosclerosis, thrombotic disease,
20 dyspepsia, memory and learning disorder and the like, pancreatic function regulator (e.g., pancreatic function improving agent), insulin secretagogue, a hypoglycemic agent or pancreatic β cell protector. Diabetes includes insulin-dependent (type I) diabetes, non-insulin-dependent (type II)
25 diabetes, gestational diabetes and the like.

The (i) GPR40 antagonist and (ii) compound decreasing the binding force between fatty acid and GPR40 or a salt thereof, which are obtained using the screening method or screening kit of the present invention, are useful as an agent for the
30 prophylaxis or treatment of, for example, diseases such as obesity, hyperlipidemia, type II diabetes, hypoglycemia, hypertension, diabetic neuropathy, diabetic nephropathy, diabetic retinopathy, edema, insulin resistance syndrome, unstable diabetes, fatty atrophy, insulin allergy, insulinoma,

arteriosclerosis, thrombotic disease, lipotoxicity, hyperinsulinemia, cancer and the like, pancreatic function regulator (e.g., pancreatic function improving agent), insulin secretion suppressing agent, pancreatic β cell protector, 5 hypoglycemic drug. Here, hyperlipidemia includes hypertriglyceridemia, hypercholesterolemia, hypo-HDL-cholesterolemia, postprandial hyperlipidemia and the like. Particularly, an antagonist to GPR40 is effective for hypoglycemia since it suppresses excess insulin secretion, and 10 prevents fatigue of pancreatic β cell caused by excessive insulin secretion (protection of pancreatic β cells) and thus effective for type II diabetes.

The GPR40 agonist or GPR40 antagonist obtained using the screening method or screening kit of the present invention can 15 be used in combination with the aforementioned concomitant drugs. In this case, the administration period of a GPR40 agonist or GPR40 antagonist obtained using the screening method or screening kit of the present invention, and a concomitant drug is not limited, and they may be 20 simultaneously administered to the administration subject, or may be administered in a staggered manner. The dose of the concomitant drug can be appropriately selected based on the dose clinically employed. In addition, the mixing rate of the GPR40 agonist or GPR40 antagonist obtained using the screening 25 method or screening kit of the present invention and a concomitant drug can be appropriately determined according to the administration subject, administration route, target disease, condition, combination and the like. For example, when the administration subject is a human, for example, 0.01 30 to 100 parts by weight of a concomitant drug is used per 1 part by weight of the GPR40 agonist.

When the GPR40 agonist or GPR40 antagonist obtained using the screening method or screening kit of the present invention is used as the above-mentioned pharmaceutical agent, it can be

prepared in the same manner as the aforementioned pharmaceutical agent containing the compound of the present invention.

Since the preparation obtained in this way is safe and
5 low toxic, it can be administered to, for example, human and mammals (e.g., rats, mice, rabbits, sheep, pigs, cattle, cats, dogs, monkeys and the like).

While the dose of GPR40 agonist or GPR40 antagonist varies depending on the administration subject, target organ,
10 condition, administration method and the like, in the case of oral administration, it is generally, for example, about 0.1 to 100 mg, preferably about 1.0 to 50 mg, more preferably about 1.0 to 20 mg, of a GPR40 agonist for diabetic patients (body weight 60 kg) for one day. For parenteral
15 administration, while the dose varies depending on the administration subject, target organ, condition, administration method and the like, it is generally conveniently, for example, about 0.01 to about 30 mg, preferably about 0.1 to about 20 mg, more preferably about 0.1
20 to about 10 mg of a GPR40 agonist for diabetic patients (body weight 60 kg) by intravenous injection. For other animals, a dose converted to the amount per on the body weight 60 kg can be administered.

10 overnight in a CO₂ incubator. Changes in the intracellular calcium concentration was measured using FLIPR (Molecular Device). The method is described in the following.

Fluo-3AM (DOJIN) (50 μ g) was dissolved in 21 μ l DMSO (DOJIN), and an equal amount of 20% pluronic acid (Molecular
15 Probes) was added and mixed, and the mixture was added to 10.6 ml of an assay buffer [prepared by adding 20 ml of 1M HEPES (pH 7.4) (DOJIN) to HBSS (Invitrogen), and adding a mixed solution (10 ml) obtained by dissolving probenecid (Sigma) (710 mg) in 1N NaOH (5 ml) and adding and mixing with the
20 above-mentioned HBSS/HEPES solution (5 ml)] supplemented with 105 μ l of fetal calf serum to give a fluorescence dye solution. The medium in the cell plate was removed, a fluorescence dye solution was immediately dispensed at 100 μ l per well, and incubated in a CO₂ incubator at 37°C for 1 hr to incorporate
25 fluorescence dye into the cell. The incubated cells were washed with the above-mentioned assay buffer. The compound of the present invention to be added to the cell was diluted with an assay buffer to each concentration and dispensed to a plate.

For antagonist measurement, 12 μ M γ -linolenic acid solution
30 (final concentration during reaction 3 μ M) was dispensed to the plate, and simultaneously set on FLIPR. After the above-mentioned pretreatment, variation in the intracellular calcium concentration after addition of the compound of the present invention was measured by FLIPR, and the agonistic effect,

subsequently an antagonistic effect upon addition of γ -linolenic acid were examined. Since the compound of the present invention is an agonist, evaluation of the antagonist is not established by an experiment using the compound of the present invention, but when a compound having solely an antagonistic effect is added, the activity to suppress reaction of γ -linolenic acid to be added later can be observed.

EC₅₀ value was calculated from a dose response curve based on the changes in the fluorescence intensity value at 30 or 40 sec after the start of the reaction.

(2) Criterion to select agonist candidates from the results of FLIPR assay

A test compound used for selecting an agonist candidate was diluted in advance with DMSO (Wako) to a concentration of 10 mM, and diluted with the above-mentioned assay buffer when used for the measurement. Using the test compound and by a method similar to the above-mentioned method, the fluorescence intensity values in CHO cell line (CHO-hGPR40 No.104), which was made to express human GPR40 prepared by a method known *per se*, using human GPR40 expression vector prepared in Reference Example 1, CHO cell line (CHO-H1), which was made to express human histamine H1 receptor prepared by a method known *per se*, using human histamine H1 receptor expression vector, and CHO cell line of Mock were measured at 30 or 40 sec after the start of the reaction. Moreover, the relative value when fluorescence strength of 30 μ M γ -linolenic acid to CHO-hGPR40 was 100% was calculated, and a test compound showing a value of not less than 50 or 100% relative to CHO-hGPR40 and not more than 25% relative to both the human histamine H1 receptor and CHO cell line of Mock were selected as human GPR40 specific agonist candidates.

Experimental Example 1 Confirmation of reactivity of fatty acid to human-derived GPR40

Unless specifically indicated, CHO-K1 cell line was cultured using Ham's F-12 medium (Invitrogen) containing 10%
30 fetal calf serum (Invitrogen). The day before transfection, 4.5×10^5 per 10 cm^2 of cells were seeded, and incubated at 37°C for not less than 15 hrs in a CO₂ incubator adjusted to 5% CO₂ concentration. The transfection was performed using a lipofectamine reagent (Invitrogen) and according to the

reagent attached method. When a 6-well plate was used for a culture plate, transfection was performed in the following manner. First two 1.5 ml volume tubes were prepared, and 100 μ l of Opti-MEM-I medium (Invitrogen) was dispensed. Then, 1 μ g
5 of an expression vector was added to one tube and 6 μ l of a lipofectamine reagent was added to the other tube. They were mixed and stood still at room temperature for 20 min. A mixed solution for transfection containing this solution and Opti-MEM-I medium (800 μ l) was added to CHO-K1 cell previously
10 washed with Opti-MEM-I medium, and incubated in a CO₂ incubator for 6 hrs. The incubated cells were rinsed with PBS (Invitrogen), detached with 0.05% trypsin-EDTA solution (Invitrogen), recovered by centrifugation. The obtained cells were counted, diluted such that 5×10^4 cells were contained per
15 200 μ l of the medium, dispensed to black walled 96-well plate (Costar) at 200 μ l per well, incubated overnight in a CO₂ incubator. Various test samples were added to CHO-K1 cells transiently expressing the receptor by the above-mentioned transfection step, and changes in the intracellular calcium
20 concentration then was measured using FLIPR (Molecular Device). For measurement of changes in intracellular calcium concentration by FLIPR, the following pretreatment was applied. First, an assay buffer for adding fluorescence dye Fluo-3AM (DOJIN) to the cell, or washing the cell immediately before
25 FLIPR assay was prepared. To a solution (hereinafter HBSS/HEPES solution) obtained by adding 20 ml of 1M HEPES (pH 7.4) (DOJIN) to 1000 ml of HBSS (Invitrogen) was added a solution (10 ml) obtained by dissolving probenecid (710 mg, Sigma) in 1N NaOH (5 ml) and adding and mixing with HBSS/HEPES
30 solution (5 ml) and the obtained solution was used as an assay buffer. Then, Fluo-3AM (50 μ g) was dissolved in 21 μ l of DMSO (DOJIN), and an equal amount of 20% pluronic acid (Molecular Probes) was added. The mixture was added to an assay buffer (10.6 ml) supplemented with 105 μ l of fetal calf serum to give

a fluorescence dye solution. The medium of the CHO-K1 cell after transfection treatment was removed, a fluorescence dye solution was immediately dispensed at 100 μ l per well and incubated in a CO₂ incubator for 1 hr to incorporate the
5 fluorescence dye into the cell. The incubated cells were washed with the above-mentioned assay buffer and set on FLIPR. The test sample to be added to receptor expressing CHO-K1 cell was prepared using the assay buffer and simultaneously set on FLIPR. After the above-mentioned pretreatment, changes
10 in the intracellular calcium concentration after addition of various test samples were measured by FLIPR. As a result, it was found that CHO-K1 cell that expresses the GPR40 receptor specifically responds (increase in intracellular calcium concentration) when farnesoic acid, 5.8.11-eicosatriynoic acid,
15 5.8.11.14-eicosatetraynoic acid, oleic acid, linoleic acid, linolenic acid, arachidonic acid, eicosapentaenoic acid (EPA), eicosadienoic acid, eicosatrienoic acid, docosahexaenoic acid (DHA), docosatrienoic acid, adrenic acid, lauric acid and the like are added at 10^{-5} M - 10^{-6} M. CHO-K1 cell into which only
20 the control expression vector alone was introduced did not show such response. In other words, it was clarified that an endogenous ligand of GPR40 was fatty acid.

Experimental Example 2 Expression distribution

(1) Cell and medium

25 NIH-3T3 and B104 cells were purchased from the ATCC. As mouse pancreatic β cell line, MIN6 described in a literature (Jun-ichi Miyazaki et al. Endocrinology, Vol. 127, No. 1, p126-132) was used. Respective cells were incubated in DMEM medium (Invitrogen) containing 10% FCS to preconfluent.

30 (2) Extraction of RNA and cDNA synthesis

The cDNA used for the expression distribution in human and mouse tissues was obtained by reverse transcription reaction from polyA+RNA (1 μ g, Clontech) derived from various tissues of human and mouse using random primer. Using reverse

transcriptase SuperScriptII (GIBCO BRL), the reaction was carried out according to the attached protocol and ethanol precipitation was performed and the precipitate was dissolved in TE (100 μ l).

5 As to cDNA from the mouse cell, the cells were detached with Trypsin-EDTA, the number of the cells was counted, and the total RNA was extracted and purified according to the manual of RNeasy mini KIT (QIAGEN). The extracted RNA (1 μ g) was processed according to the manual of SuperScript II
10 (Invitrogen) using random to synthesize a first strand cDNA, which was subjected to ethanol precipitation, and the precipitate was dissolved in TE (10 μ l).

(3) Quantitation using TaqMan

The tissue-derived cDNA (corresponding to 5 ng of RNA)
15 and cell line-derived cDNA (corresponding to 25 ng of RNA) were adjusted to the total reaction mixture of 15 μ l with amplification reaction reagent TaqMan (trademark) Universal PCR Master Mix (Applied Biosystems Japan Ltd.) and TaqMan (trademark) Probe Kit for GPR40 detection (sequence: 11-16,
20 Applied Biosystems Japan Ltd.), and the reaction was carried out. The final concentration of each primer and probe followed the manual.

TaqMan (trademark) PCR was performed in ABI PRISM (trademark) 7900HT sequence detection system (Applied
25 Biosystems Japan Ltd.), and the temperature cycle used followed the manual of TaqMan (trademark) Universal PCR Master Mix (Applied Biosystems Japan Ltd.).

The quantitative TaqMan analysis of the amplified product was performed using 7900HT SDS software (Applied Biosystems
30 Japan Ltd.). The analytical curve used for the calculation of copy number was formed from C_T values at 6 points in the logarithm from 10^7 copies/well to 10^2 copies/well using a concentration-known cDNA fragment (human GPR40) or Plasmid DNA (mouse GPR40) containing full length amplified region.

In human tissues, relatively high expression was observed in pancreas, lung, hippocampus, hypothalamus and spinal cord. In mouse, extremely high expression was observed in pancreatic cancer-derived cell.

5 **Experimental Example 3** Insulin secretagogue effect of free fatty acid in mouse insulinoma MIN6 cell

Unless otherwise specified, MIN6 cell was incubated in DMEM (high glucose, Invitrogen) containing 15% FCS (Trace Scientific Ltd.), 55 μ M 2-mercaptoethanol, 100 U/ml penicillin,
10 and 100 μ g/ml streptomycin. Min6 cells were seeded in a 96 well plate at 10^5 cells per well, and incubated at 37°C for 3 days in a CO₂ incubator adjusted to 5% CO₂ concentration. The medium was exchanged to RPMI1640 (glucose-free, Invitrogen) containing 10% FCS (Trace Scientific Ltd.), 5.5 mM glucose,
15 100 U/ml penicillin and 100 μ g/ml streptomycin and the cells were further incubated for 24 hrs. The medium was aspirated, free fatty acid-bovine serum albumin (BSA) mixed solution (4:1, molar ratio) diluted with RPMI1640 (glucose-free, Invitrogen) containing 10% FCS (Trace Scientific Ltd.), 11 mM glucose, 100
20 U/ml penicillin, and 100 μ g/ml streptomycin was added to the cells and reacted at 37°C for 90 min. (or 60 min.) in a CO₂ incubator adjusted to 5% CO₂ concentration. The 96 well plate after reaction was centrifuged at 1500 rpm for 5 min. and the culture supernatant was recovered. The insulin amount
25 secreted in this culture supernatant liquid was determined by radioimmunoassay (RIA) using a rat insulin RIA system (Amersham Pharmacia Biotech). As a result, it was found that the insulin secretion by Min6 cell was promoted when 300 μ M-1000 μ M of free fatty acid such as palmitic acid, γ -linolenic
30 acid, oleic acid and the like was added. That is, it was clarified that the free fatty acid promotes insulin secretion in mouse insulinoma MIN6 cell. Since MIN6 cell specifically and extremely highly expresses GPR40, it is considered that the added fatty acid insulin promotes secretion via GPR40.

Experimental Example 4 Effect of regulation of GPR40 receptor function (agonistic effect)

5 to a black walled 96-well plate (Costar) at 100 μ L per well, and incubated overnight in a CO₂ incubator. The changes in the intracellular calcium concentration were measured using FLIPR (Molecular Device). The method is described in the following.

Fluo-3AM (DOJIN) (50 μ g) was dissolved in 21 μ l DMSO
10 (DOJIN), and an equal amount of 20% pluronic acid (Molecular Probes) was added and mixed, and the mixture was added to 10.6 ml of an assay buffer [prepared by adding 20 ml of 1M HEPES (pH 7.4) (DOJIN) to 1 L of HBSS (Invitrogen), and adding a mixed solution (10 ml) obtained by dissolving probenecid
15 (Sigma) (710 mg) in 1N NaOH (5 ml) and adding and mixing with the above-mentioned HBSS/HEPES solution (5 ml)] supplemented with 105 μ l of fetal calf serum to give a fluorescence dye solution. The medium in the cell plate was removed, a fluorescence dye solution was immediately dispensed at 100 μ l
20 per well, and incubated in a CO₂ incubator for 1 hr to incorporate fluorescence dye into the cell. The incubated cells were washed with the above-mentioned assay buffer. The compound to be added to the cell was diluted with the assay buffer to each concentration and dispensed to a test sample
25 plate. After the above-mentioned pretreatment, changes in the intracellular calcium concentration after addition of the compound was measured by FLIPR, and the agonistic effect was examined. EC₅₀ value was calculated from a dose response curve based on the changes in the fluorescence intensity value at 30
30 sec after the start of the reaction. The results are shown in Table 1.

Experimental Example 5 Suppression of expression of mouse
GPR40-GFP fused protein by introduction of siRNA specific to
25 mouse GPR40

CHO cell expressing fused protein of mouse GPR40 and GFP prepared by a method known per se was seeded in a 96 well plate at 3×10^4 /well and incubated for one day. siRNA of various sequences (Dharmacon) (concentration of 2.86 pmol/0.5
30 μ l or 8.57 pmol/1.5 μ l) prepared using HVJ Envelope VECTOR KIT GenomONE™ (ISHIHARA SANGYO) and according to the report of Elbasir et al. (Nature 411 (6836), 494-498 (2001)) was introduced into the cells and the cells were further incubated for one day. The expression amount of mouse GPR40-GFP was

detected by the following enzyme immunoassay. The culture supernatant was discarded, washed with HBSS (Invitrogen), fixed with 0.01% glutaraldehyde (Wako Pure Chemical Industries, Ltd.) for 5 min., and blocked with PBS (TAKARA SHUZO) containing 2% BSA. 500-fold diluted anti-GFP monoclonal antibody 3E6 (NIPPON GENE CO., LTD.) was added and the cells were incubated at room temperature for 2 hrs., washed and 500-fold diluted HRP-labeled anti-mouse IgG antibody (ICN) was added, and the cells were incubated at room temperature for 2 hrs. After washing, TMB microwell peroxydase substrate (Funakoshi) was added and, after incubation for 30 min., sulfuric acid was added to stop the color developing reaction, and the absorbance at 450 nm was measured. As a result, addition of m40i103, which is a mouse GPR40 specific siRNA (sense strand is SEQ ID NO: 23, antisense strand is SEQ ID NO: 24), m40i256 (sense strand is SEQ ID NO: 25, antisense strand is SEQ ID NO: 26) to mouse GPR40-GFP expressing CHO cell caused lower GPR40-GFP expression amount. Therefrom it was found that m40i103 and m40i256 specifically suppress mouse GPR40 expression.

Experimental Example 6 Promotion by various fatty acids of insulin secretion from MIN6

Mouse pancreatic β cell line MIN6 cultured in a flask was detached with PBS containing 2.5 mM EDTA, and seeded and incubated in a 96 well plate for 2 days. The medium used was obtained by adding 15% fetal bovine serum (ThermoTrace), 5.5 μ M 2-mercaptoethanol (Invitrogen), 20 mM HEPES pH 7.3, 100 U/ml penicillin and 100 μ g/ml streptomycin to Dulbecco's Modified Eagle Medium (DMEM, Invitrogen) containing 4.5 g/l of glucose. The cells were washed twice with modified Krebs-Ringer bicarbonate buffer (KRBH, 116 mM NaCl, 4.7 mM KCl, 1.2 mM KH_2PO_4 , 1.2 mM MgSO_4 , 2.5 mM CaCl_2 , 25 mM NaHCO_3 , 24 mM HEPES pH 7.3) and preincubated at 37°C under 5% CO_2 conditions for 30 min. Fatty acid diluted and prepared with a buffer obtained

by adding 22 mM glucose to the above-mentioned KRBH was added to the cell after preincubation and the cells were incubated at 37°C under 5% CO₂ conditions for 90 min. After incubation, the cell supernatant was recovered and cryopreserved. The
5 insulin content of the supernatant was measured using a commercially available insulin immunoassay kit (Amersham Pharmacia Biotech). As a result, a significant insulin secretion enhancing activity was found by oleic acid, linoleic acid, α -linolenic acid, γ -linolenic acid, arachidonic acid and
10 DHA, which are fatty acid that showed a remarkable activity in an intracellular calcium ion mobilization assay using CHO cell expressing GPR40. In contrast, methyl linolate (linoleic methyl) and butyric acid that show no GPR40 agonistic activity did not show a significant insulin secretion enhancing
15 activity. Since the GPR40 agonistic activity and the insulin secretion enhancing activity are almost correlated, it was demonstrated that GPR40 plays at least some role in insulin secretion enhancing action by fatty acid.

Experimental Example 7 Glucose dependency of insulin
20 secretion enhancing activity via GPR40

The effect of glucose concentration on the addition of fatty acid was examined based on the method of Experimental Example 6. The concentration of glucose added to KRBH during fatty acid addition was changed to 0, 5.5, 11, 22 mM and
25 examined. As a result, insulin secretion enhancing activity of oleic acid and linoleic acid was found to be remarkable under high glucose concentration conditions of not less than 11 mM. Therefrom the insulin secretion enhancing activity by fatty acid showing GPR40 agonistic activity is expected to
30 show insulin secretion enhancing activity and effect on blood glucose under hyperglycemia conditions.

Experimental Example 8 Inhibitory effect of fatty acid on insulin secretion enhancing activity in siRNA-introduced MIN6

In Experimental Example 5, m40i103, which is GPR40

specific siRNA, was confirmed to remarkably suppress expression of mouse GPR40. Insulin secretion enhancing activity in MIN6 cell, into which m40i103 was introduced using HVJ Envelope VECTOR KIT GenomONE based on the method of Experimental Example 5, was examined. The insulin secretion enhancing activity by fatty acid was examined by the method of Experimental Example 6. As a result, m40i103 introduced MIN6 no longer showed insulin secretion enhancing activity by linoleic acid and γ -linolenic acid. In contrast, MIN6 into which Scramble II duplex siRNA, which is a random sequence siRNA, was introduced showed retention of the insulin secretion enhancing activity by the above-mentioned fatty acid. From these results, it was confirmed that GPR40 plays at least some role in the insulin secretion enhancing mechanism by fatty acid.

Experimental Example 9 Promoting effect of insulin secretion from MIN6

Mouse pancreatic β cell line MIN6 cultured in a flask was detached with PBS containing 2.5 mM EDTA, and seeded and incubated in a 96 well plate for 2 days. The medium used was obtained by adding 15% fetal bovine serum (ThermoTrace), 5.5 μ M 2-mercaptoethanol (Invitrogen), 20 mM HEPES pH 7.3, 100 U/ml penicillin and 100 μ g/ml streptomycin to Dulbecco's Modified Eagle Medium (DMEM, Invitrogen) containing 4.5 g/l of glucose. The cells were washed twice with modified Krebs-Ringer bicarbonate buffer (KRBH, 116 mM NaCl, 4.7 mM KCl, 1.2 mM KH_2PO_4 , 1.2 mM MgSO_4 , 2.5 mM CaCl_2 , 25 mM NaHCO_3 , 24 mM HEPES pH 7.3) and preincubated at 37°C under 5% CO_2 conditions for 30 min. The compound diluted and prepared with a buffer obtained by adding 22 mM glucose to the above-mentioned KRBH was added to the cell after preincubation and the cells were incubated at 37°C under 5% CO_2 conditions for 90 min. After incubation, the cell supernatant was recovered and cryopreserved. The insulin content of the supernatant was measured using a

commercially available insulin immunoassay kit (Amersham Pharmacia Biotech). As a result, as shown in Fig. 1, a significant insulin secretion enhancing activity was observed by the addition of the compound of Example 41.

5. **Experimental Example 10** In vivo insulin secretion promoting effect and hypoglycemic action

Male SD rats (CLEA Japan, Inc, 7-week-old) were fasted for one day, and divided into groups (6 per group) based on blood glucose level and body weight. A suspension of the
10 compound of Example 41 in 0.5% methyl cellulose was orally administered at the dose of 30 mg/kg and glucose (2 g/kg) was orally loaded at 30 min after administration. Only 0.5% methyl cellulose was administered to the control group, and similarly loaded with glucose. Plasma was taken before
15 glucose tolerance test, and 7, 30 and 60 minutes after glucose tolerance test, and the blood glucose level and insulin concentration were measured. The blood glucose level was measured by HITACHI autoanalyzer 7070, and insulin was measured by radioimmunoassay ($[^{125}\text{L}]$ Sionoria insulin, Shionogi
20 & Co., Ltd.). As a result, as compared to the control group, the Example 41 compound administration group showed significantly suppressed increase in the blood glucose level at 30 minutes after glucose tolerance test (Fig. 2, Williams test, $p \leq 0.025$), and significantly greater increase in insulin
25 at 7 minutes after glucose tolerance test (Fig. 3, Williams test, $p \leq 0.025$). From these results, it was clarified that the compound of Example 41 shows both the insulin secretion promoting effect and hypoglycemic action in rat.
